

AMENDMENT AND RESPONSE

PAGE 2

Serial No.: 10/668,752

Filing Date: 9/23/2003

Attorney Docket No. 125.067US02

Title: METHODS TO CONTROL THE DROOP WHEN POWERING DUAL MODE PROCESSORS AND ASSOCIATED CIRCUITS

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of claims:

1. (Canceled)

2. (Currently amended) A method of operating a DC/DC converter having an output coupled to a load with two or more modes of operations, the method comprising:
coupling a power source to an input of the DC/DC converter;
creating a droop in an output signal to the load in response in part to a signal from the power source and in response in part to the operating mode of the load such that the droop is substantially symmetrical throughout the operational modes of the DC/DC converter[.]; and
~~The method of claim 1,~~ wherein creating the droop in the output signal further comprises:
multiplying a sensed current in a feedback loop with a signal that is inversely proportional to a frequency of the load.

3. (Currently amended) A method of operating a DC/DC converter having an output coupled to a load with two or more modes of operations, the method comprising:
coupling a power source to an input of the DC/DC converter;
creating a droop in an output signal to the load in response in part to a signal from the power source and in response in part to the operating mode of the load such that the droop is substantially symmetrical throughout the operational modes of the DC/DC converter[.]; and
~~The method of claim 1,~~ wherein creating the droop in the output signal further comprises[.]:
multiplying a sensed current in a feedback loop with a signal that is inversely proportional to a reference voltage, wherein the reference voltage is associated with a desired operating voltage of the load.

4. (Currently amended) A method of operating a DC/DC converter having an output coupled to a load with two or more modes of operations, the method comprising:

Serial No.: 10/668,752

Filing Date: 9/23/2003

Attorney Docket No. 125.067US02

Title: METHODS TO CONTROL THE DROOP WHEN POWERING DUAL MODE PROCESSORS AND ASSOCIATED CIRCUITS

coupling a power source to an input of the DC/DC converter;
creating a droop in an output signal to the load in response in part to a signal from the
power source and in response in part to the operating mode of the load such that the droop is
substantially symmetrical throughout the operational modes of the DC/DC converter[.]; and
~~The method of claim 1,~~ wherein creating the droop in the output signal further comprises[:]

multiplying a sensed current in a feedback loop with a signal inversely proportional to a reference voltage and a signal inversely proportional to a frequency in which the load operates, wherein the reference voltage is reflective of a desired operating voltage of the load.

5. (Currently amended) A method of operating a DC/DC converter having an output coupled to a load with two or more modes of operations, the method comprising:

coupling a power source to an input of the DC/DC converter;
creating a droop in an output signal to the load in response in part to a signal from the
power source and in response in part to the operating mode of the load such that the droop is
substantially symmetrical throughout the operational modes of the DC/DC converter[.]; and
~~The method of claim 1,~~ wherein creating the droop in the output signal further comprises[:]

multiplying a sensed current in a feedback loop with a signal that is inversely proportional to a reference voltage squared, wherein the reference voltage is reflective of a desired operating voltage of the load.

6. (Currently amended) A method of operating a DC/DC converter having an output coupled to a load with two or more modes of operations, the method comprising:

coupling a power source to an input of the DC/DC converter;
creating a droop in an output signal to the load in response in part to a signal from the
power source and in response in part to the operating mode of the load such that the droop is
substantially symmetrical throughout the operational modes of the DC/DC converter[.]; and
~~The method of claim 1,~~ wherein creating the droop in the output signal further comprises[:]

controlling a gain of a buffer amplifier in a feedback loop with a frequency signal proportional to the frequency in which the load operates.

AMENDMENT AND RESPONSE

PAGE 4

Serial No.: 10/668,752

Filing Date: 9/23/2003

Attorney Docket No. 125.067US02

Title: METHODS TO CONTROL THE DROOP WHEN POWERING DUAL MODE PROCESSORS AND ASSOCIATED CIRCUITS

7. (original) The method of claim 6, wherein the frequency signal is derived from a reference voltage, wherein the reference voltage is associated with a desired operating voltage of the load.

8-11 (canceled).
